

Type 330/335/340/345 Series

**Instrument Air Filter Regulator & Regulator**Type-330 Filter Regulator | Type-335 NACE Filter Regulator
Type-340 Regulator | Type 345 Filter

The Type 330/335/340/345 Series of Instrument Air Filter Regulators and Regulators are designed to provide clean, accurate air pressure to instruments, valves, and other automatic control equipment in a lightweight, compact housing. These quality instruments are constructed of durable materials that will provide long lasting performance in industrial environments.

### **Type 330 Filter Regulator**

Designed for use in systems that require clean, accurate instrument air, the Type 330 provides pressure regulation and filtration in an integral compact package. Available in  $\frac{1}{2}$ " NPT porting for normal operation and  $\frac{1}{2}$ " NPT porting for high flow capacity requirements.

# Type 330 Filter Regulator with Automatic Drain

Condensate waste liquid is automatically expelled from the bowl when the liquid reaches a specific level. The low maintenance Automatic Drain helps prolong the life of the regulator and filter by preventing corrosion on the bottom of regulator and reducing the load of the filter.

# Type 335 NACE Filter Regulator

Materials in the Type 335 meet NACE MR-0175 requirements (available in 1/4" only)

### Type 340 Regulator

Designed to provide accurate, constant control under variable flow rates and supply pressures. Compact and lightweight housing allows this unit to be mounted in applications where space is limited. Its durable construction withstands long term installation in harsh environments.

### Type 345 Filter

The Type 345 Filter unit is a 40-micron depth filter that removes dirt, moisture and other particles from air and gas lines. Robustly constructed of die-cast aluminum with a baked epoxy finish, this unit stands up in corrosive operating conditions. This filter is an economical alternative for air supply line applications that don't require a pressure reducing regulator. Available in 1/4" and 1/2" NPT porting, manual and automatic drain. Optional 5 micron filter.

#### **Options** Add proper letter at end of model number.

- A Automatic Drain (Type 330 & 345): Float operated drain with 1/8" NPT connection. Maximum 150 psig supply pressure
- E Tapped Exhaust: Allows captured exhaust. 1/4" NPT
- **F** 5 Micron Filter: Standard 40 micron filter is replaced with 5 micron filter for more complete air filtration
- **K** Knob: Hand wheel to replace square head adjust screw
- L Low Temperature: Range -62°F to 194°F (-52°C to 90°C)
- N Nonrelieving: For constant flow or downstream pressure relief applications
- R EAC TR-CU

#### **Principles of Operation - Type 330/335/340**

Turning the adjusting screw changes the force exerted by the range spring on the diaphragm assembly. In equilibrium of set pressure, the force exerted by the range spring is balanced by the force from the output pressure acting underneath the diaphragm assembly. An unbalanced state between the output pressure and the set pressure causes a corresponding reaction in the diaphragm and supply valve assemblies. If the output pressure rises above the set pressure, an upward force is exerted on the diaphragm assembly causing the relief seat to lift and open. Excess pressure is vented to atmosphere until equilibrium is reached. If the output pressure drops below the set pressure the unbalanced force of the range spring causes a downward force on the diaphragm assembly. The supply valve then opens until the pressure builds up once more to the equilibrium condition. Under forward flow conditions, the range spring force is balanced by the diaphragm pressure force, with the supply valve open just enough to maintain the required equilibrium pressure. When high flow occurs, a specially designed aspirator helps maintain downstream pressure and compensates for droop.
